

Variables and Datatypes

The objective of this exercise is to consolidate your understanding of variables, datatypes, string formatting, and operators.

1	Open the Begin Solution for Exercise 3. <code>{installedFolder}\Labs\03_Variables_and_Datatypes\Begin\Exercise3 Solution\Exercise3.sln</code>
2	All of the code is commented out. Go through all the numbered points (1 to 14), uncommenting each line as you go. In the case of question 10, there are a few lines to uncomment. Almost all of the lines of code have something wrong: either they won't compile or if they compile and run, they give an unexpected result. Point 14 involves setting a breakpoint to confirm the code behaves as expected. For all other code, identify what is wrong and fix it.
3	There is a Hints project if you need some tips.
4	A complete Corrected Solution is provided in the End folder for your reference.
